# Functional magnetic resonance imaging (fMRI) data

# Motivation

Modern fMRI studies of human brain use data from multiple subjects

- scientific reason
- statistical reason

How can we aggregate fMRI data from multiple subjects?

# Challenge

Inter-subject variability in anatomical structure and functional topographies

Given data from training subjects,

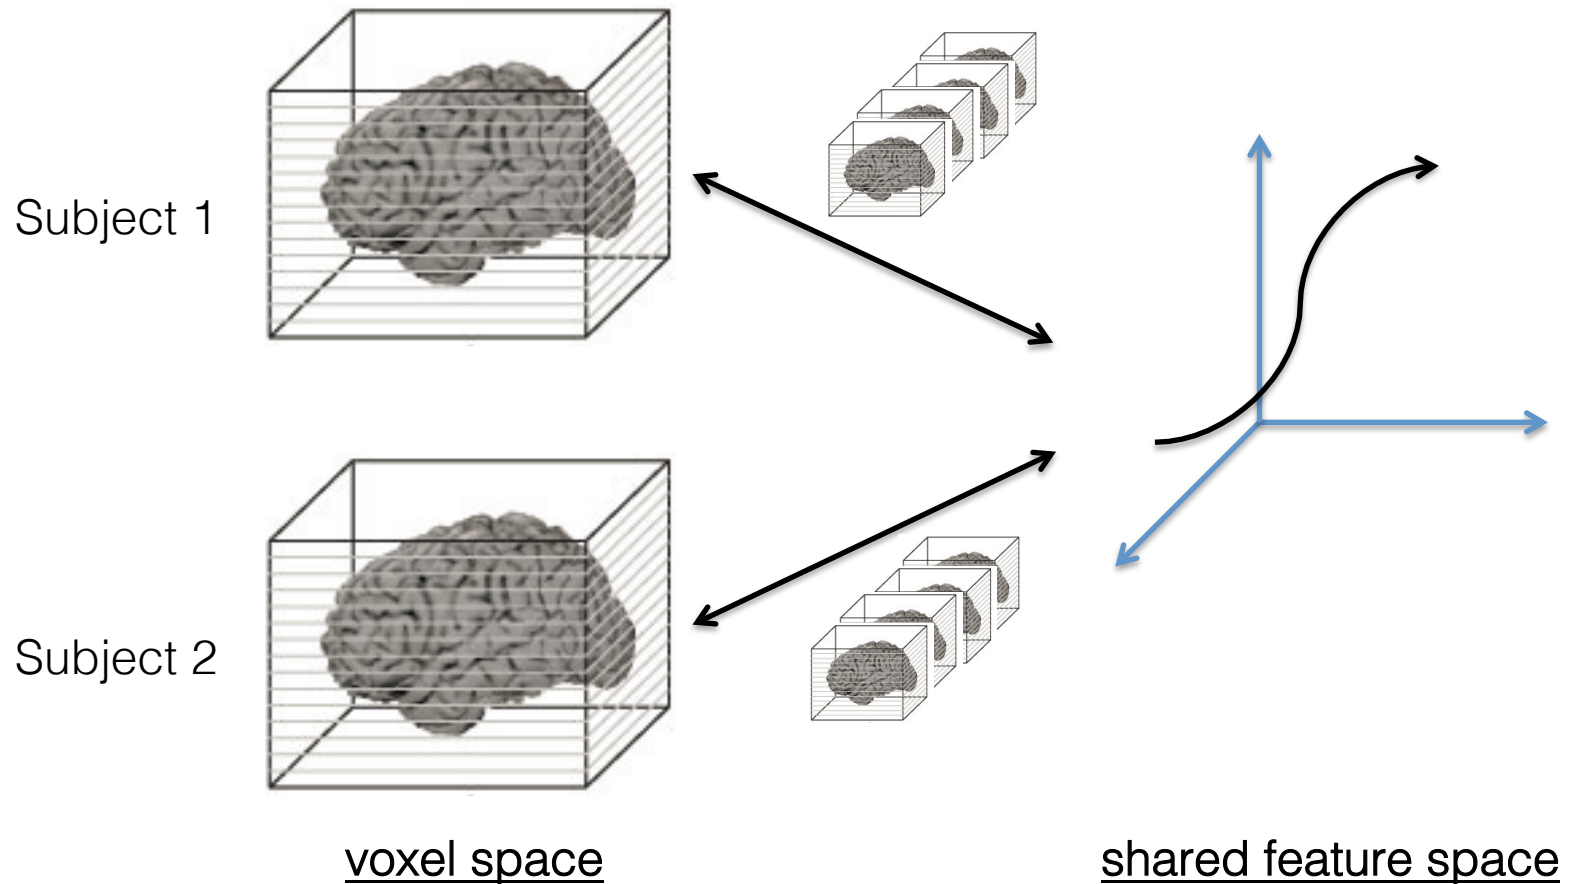

Prediction:

can we predict the brain response of a test subject?

Classification:

given brain response from a test subject, can we classify what's the stimulus?

# Learn subject specific functional topographies

# Data collected while subjects receiving stimuli

Temporally synchronized naturalistic stimuli

1. Sample a wide range of response from the subject
2. Use time as anchor for learning shared response

# Shared Response Model (SRM) is a latent variable model

$$s_t \sim \mathcal{N}(0, \Sigma_s)$$
$$x_{it}|s_t \sim \mathcal{N}(W_i s_t + \mu_i, \rho_i^2 I)$$
$$W_i^T W_i = I$$

$W_i$  not square

$s_t$  shared elicited response at time  $t$        $x_{it}$  observations of subject  $i$  at time  $t$   
 $W_i$  functional topographies for subject  $i$        $\rho_i^2$  noise level for subject  $i$ 's data

- Feature identification with dimensionality reduction
- Constrained EM algorithm

Shared features, subject specific functional topographies, and subject specific response

# Evaluation with various datasets

- Different MRI machines
- Different institutes
- Different subjects
- Different preprocessing protocols
- Different brain regions
- Different data size

# Generalization to new subject with time segment matching

# Generalization to new subject and distinct stimulus with image classification

Dataset

# Generalization to new subject and distinct stimulus with image classification

- Outperforms within-subject classification

# Classifying mental states

- 40 subjects listening to narrated story
- Separate 40 subjects into 2 groups
- Two groups receive different prior contexts
- Leading to different interpretations of the story
- Predict prior context of a left-out subject

# Classifying mental states

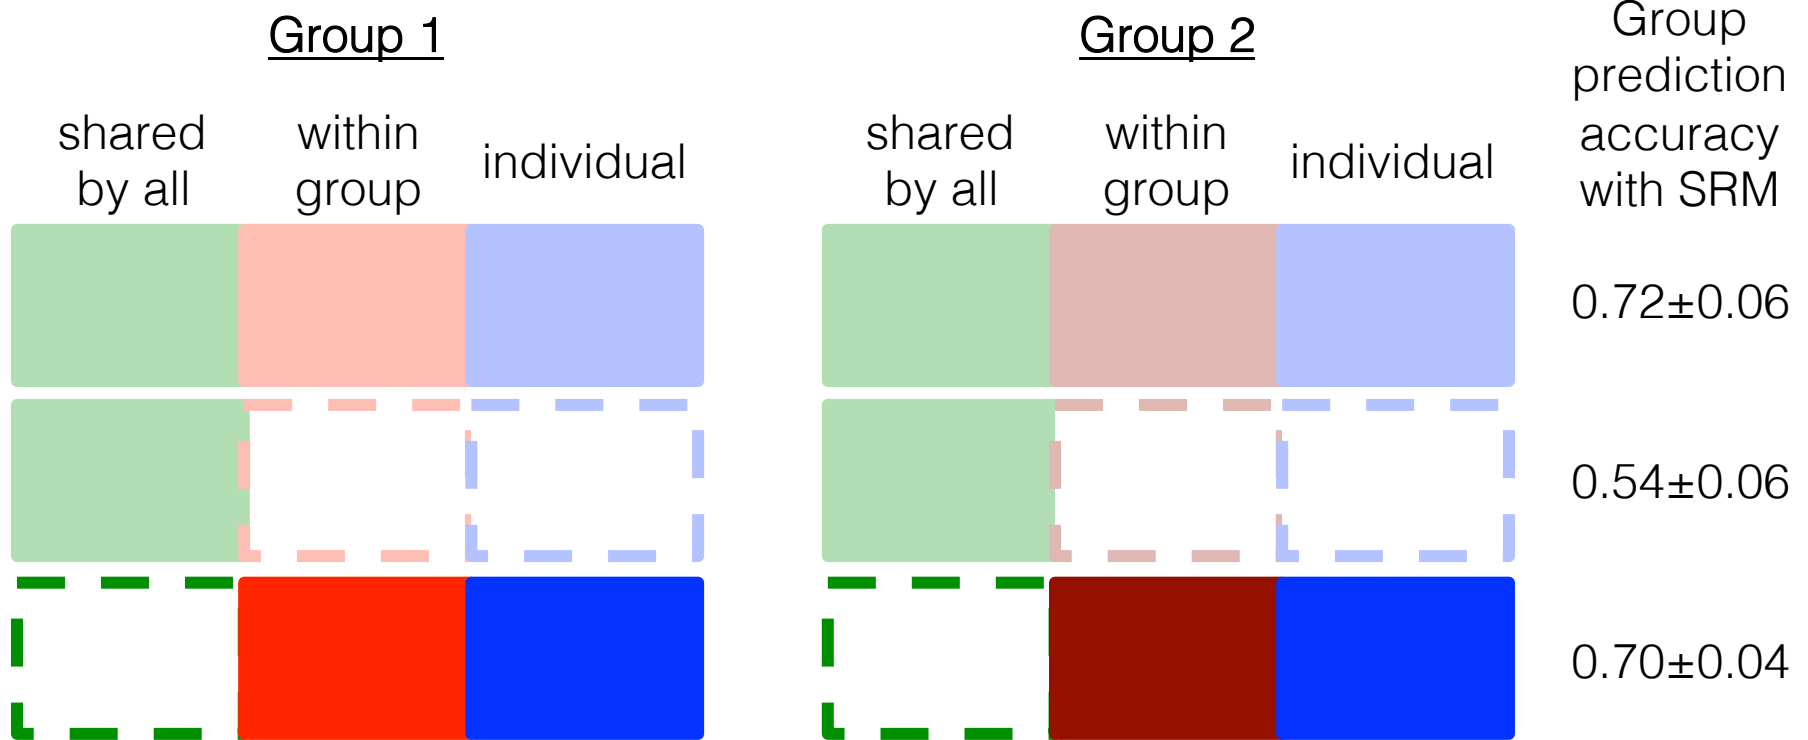

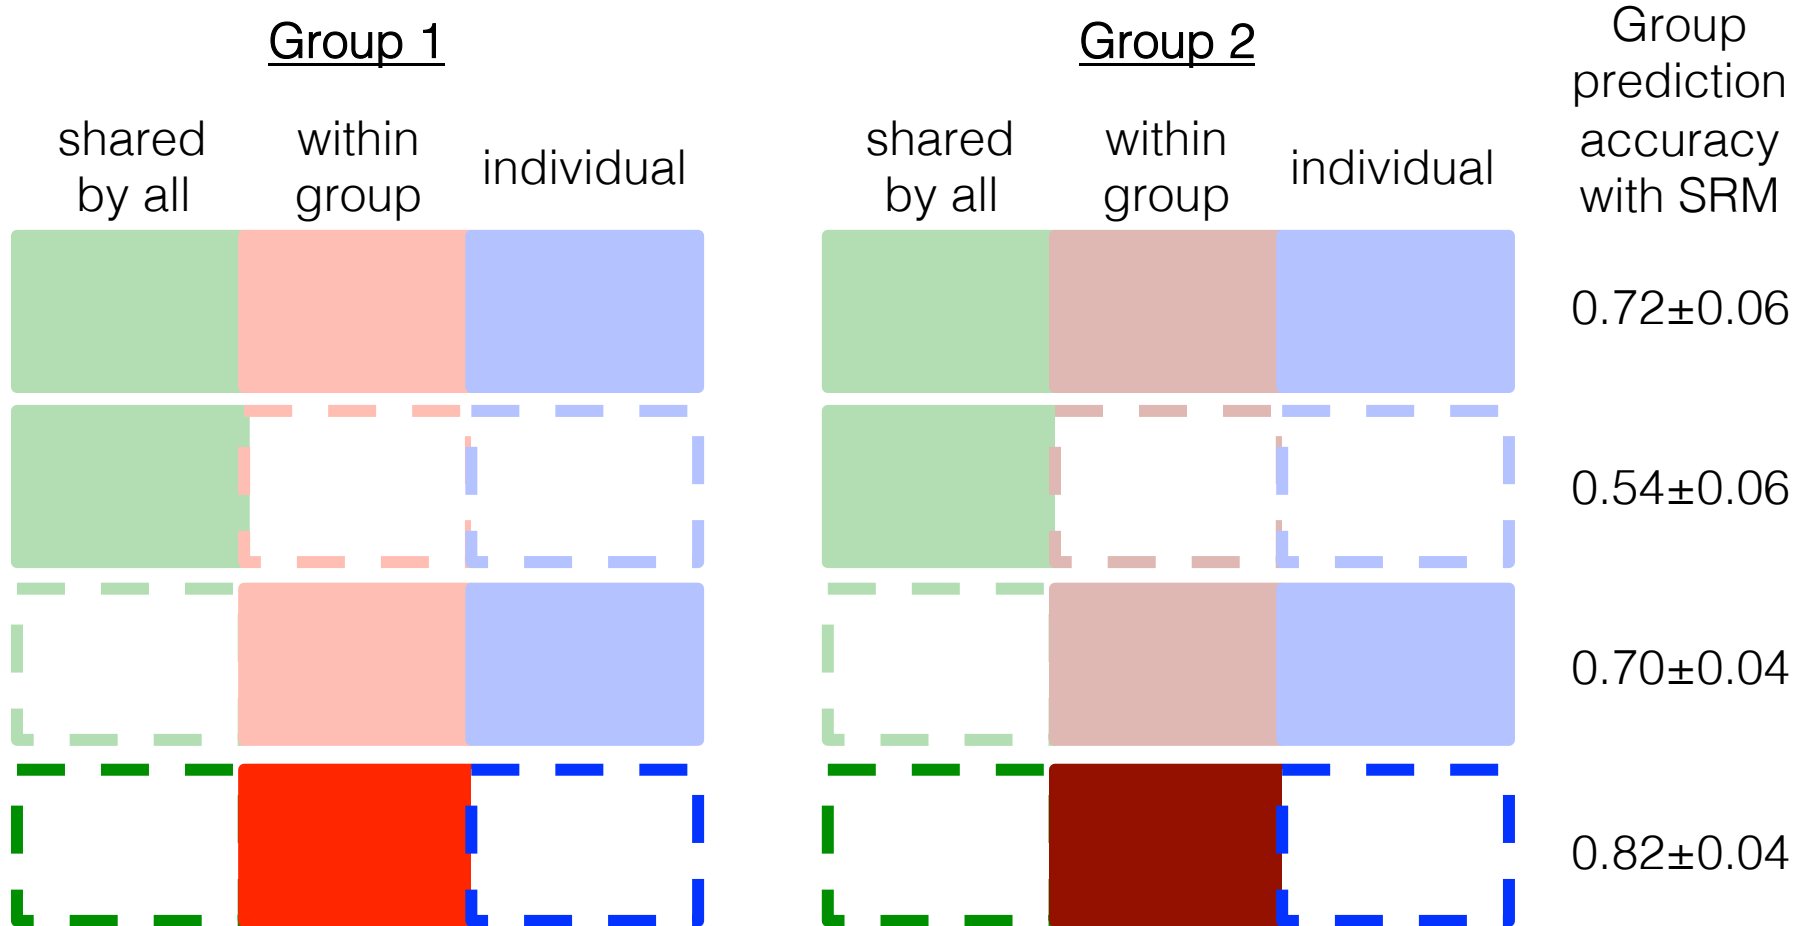

# Classifying mental states

# Classifying mental states

# Classifying mental states

# Conclusion

- SRM achieves state-of-the-art performance using multi-subject data, demonstrates higher sensitivity
- SRM outperforms within subject classification
- Low dimensional representation of brain response
- SRM decouples shared and individual responses, allowing detection of group specific responses

## Recent Extensions:

- Kernel version of SRM to unlock information in higher order statistics from fMRI data
- Information theoretic based SRM
