AlphaGo

## FINAL SCORES

Match	Black	White	Result
1	Lee Sedol	 AlphaGo	ALPHAGO WIN
2	 AlphaGo	Lee Sedol	ALPHAGO WIN
3	Lee Sedol	 AlphaGo	ALPHAGO WIN
4	 AlphaGo	Lee Sedol	LEE SEDOL WIN
5	Lee Sedol	 AlphaGo	ALPHAGO WIN

A close-up, shallow depth-of-field photograph of a Go board. The board is light-colored wood with a grid of black lines. Numerous black and white Go stones are scattered across the board, some in focus and others blurred. The background is dark and out of focus.

ARTIFICIAL INTELLIGENCE

IMMORTAL GLEESON ALICIA VIKANDER AND OSCAR ISAAC

# Artificial Intelligence (AI)

- the science devoted to **developing programs that enable computers to display behavior that can be characterized as intelligent**
- most research in AI is devoted to fairly narrow applications
- substantial interest remains in the long-range goal of building generally intelligent, autonomous agents

# The birth of 'AI'

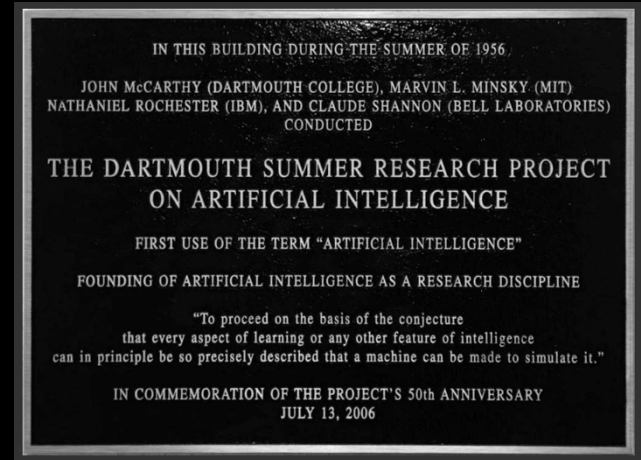

Dartmouth Conference 1956, the birth of AI

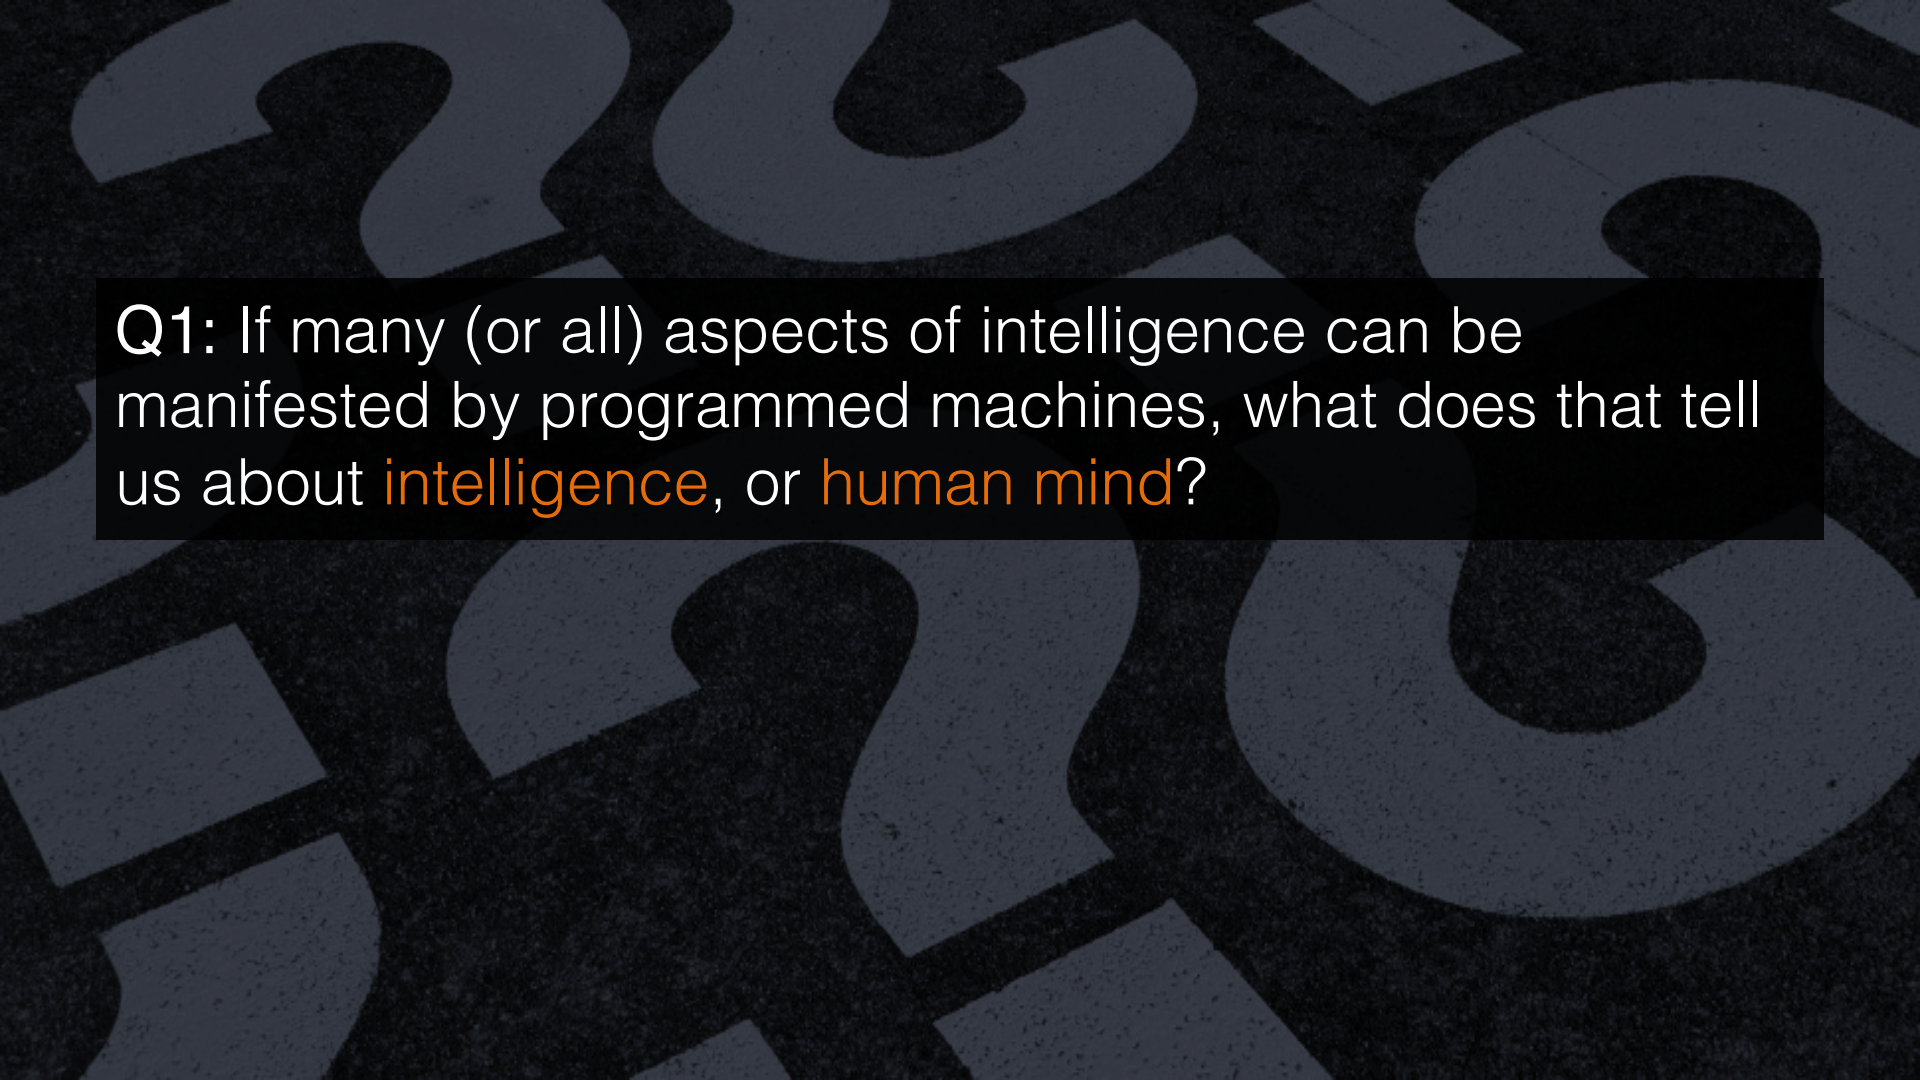

John McCarthy:

“Every aspect of learning or any other feature of intelligence can in principle be so precisely described that a machine can be made to simulate it.

An attempt will be made to find how to make machines use language, form abstractions and concepts, solve kinds of problems now reserved for humans, and improve themselves.”

Q1: If many (or all) aspects of intelligence can be manifested by programmed machines, what does that tell us about **intelligence**, or **human mind**?

# Strong AI

- human mind are essentially some programs
- suitably programmed machines can manifest mental capabilities
- An AI system can really think and have a mind

# Alan Turing: Father of CS and AI

VOL. LIX. No. 236.]

[October, 1950

## MIND

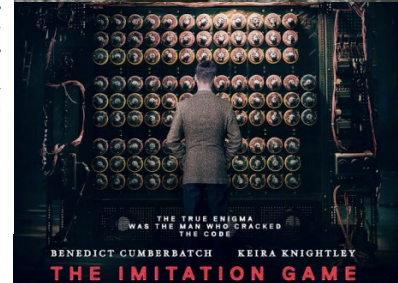

A QUARTERLY REVIEW  
OF  
PSYCHOLOGY AND PHILOSOPHY

### I.—COMPUTING MACHINERY AND INTELLIGENCE

By A. M. TURING

#### 1. *The Imitation Game.*

I PROPOSE to consider the question, 'Can machines think?' This should begin with definitions of the meaning of the terms 'machine' and 'think'. The definitions might be framed so as to reflect so far as possible the normal use of the words, but this attitude is dangerous. If the meaning of the words 'machine' and 'think' are to be found by examining how they are commonly used it is difficult to escape the conclusion that the meaning and the answer to the question, 'Can machines think?' is to be sought in a statistical survey such as a Gallup poll. But this is absurd. Instead of attempting such a definition I shall replace the question by another, which is closely related to it and is expressed in relatively unambiguous words.

# Turing Test

Alan Turing

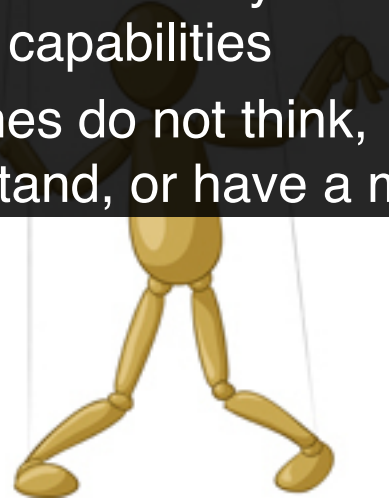

# John Searle: Chinese Room Argument

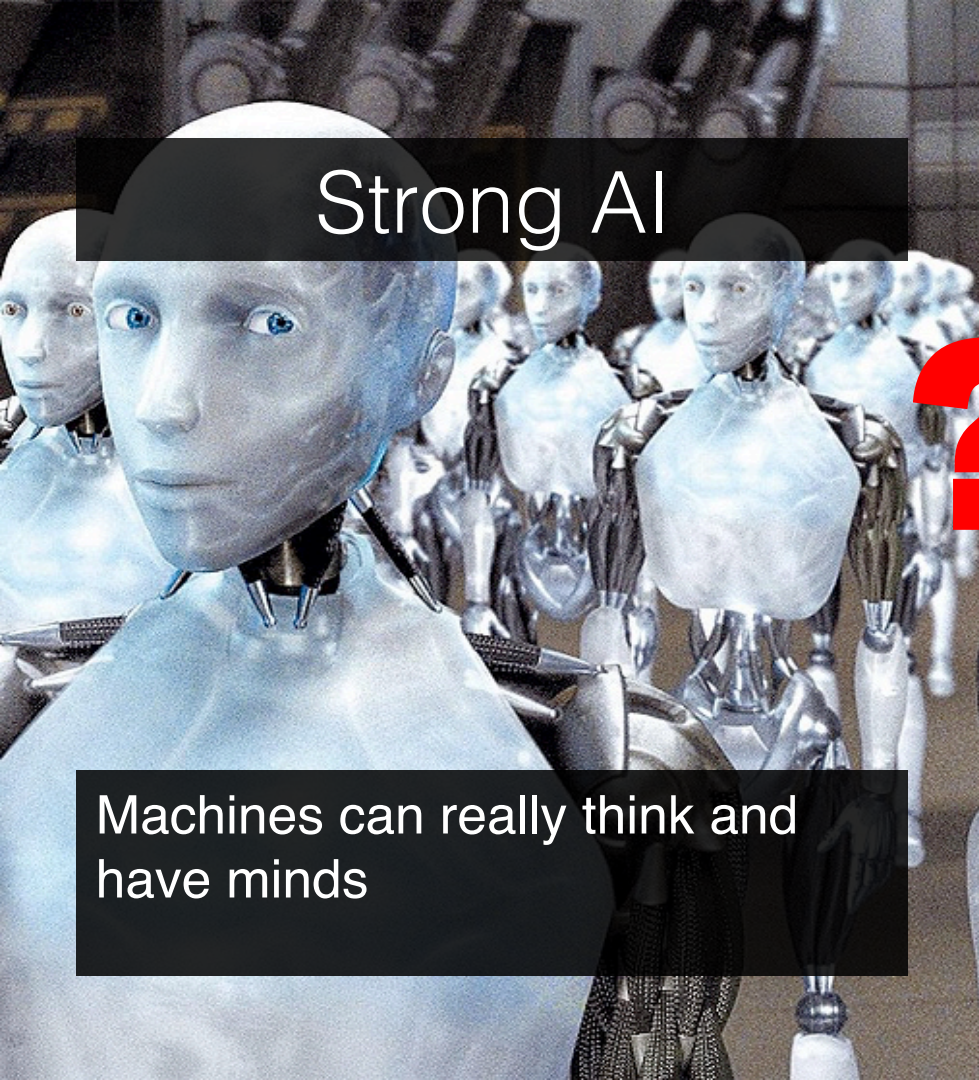

# Weak AI

- human minds are not essentially some programs
- suitably programmed machines can only simulate mental capabilities
- machines do not think, understand, or have a mind

A group of humanoid robots with blue and silver bodies, standing in a line in a futuristic, industrial setting. The robots have human-like faces with blue eyes and are wearing dark, form-fitting suits. The background shows complex machinery and structures.

Strong AI

Machines can really think and have minds

Weak AI

Machines can only simulate human minds and act like they are thinking

Q1: If many (or all) aspects of intelligence can be manifested by programmed machines, what does that tell us about intelligence, or human mind?

Q2: Is that true that all aspects of intelligence can in principle be manifested by programmed machines?

## Part II. How far have we gone?

Movements in AI research, current advancement
